## 1 Scope

#### 1.1 Identification

This software test plan provides detailed tests that are used to evaluate the stability and compliance of the Common UNIX Printing System ("CUPS") Version 1.1.

## 1.2 System Overview

CUPS provides a portable printing layer for UNIX®-based operating systems. It has been developed by <a href="Easy Software Products">Easy Software Products</a> to promote a standard printing solution for all UNIX vendors and users. CUPS provides the System V and Berkeley command-line interfaces.

CUPS uses the Internet Printing Protocol ("IPP") as the basis for managing print jobs and queues. The Line Printer Daemon ("LPD") Server Message Block ("SMB"), and AppSocket (a.k.a. JetDirect) protocols are also supported with reduced functionality. CUPS adds network printer browsing and PostScript Printer Description ("PPD") based printing options to support real—world printing under UNIX.

CUPS also includes a customized version of GNU Ghostscript (currently based off GNU Ghostscript 5.50) and an image file RIP that are used to support non–PostScript printers. Sample drivers for HP and EPSON printers are included that use these filters.

#### 1.3 Document Overview

This software test plan is organized into the following sections:

- 1 − Scope
- 2 References
- 3 Test Procedure
- 4 IPP Compliance Tests
- 5 Command Tests
- A Glossary

1 Scope 1

2 1 Scope

#### 2.1 CUPS Documentation

The following CUPS documentation is referenced by this document:

- CUPS-CMP-1.1: CUPS Configuration Management Plan
- CUPS-IDD-1.1: CUPS System Interface Design Description
- CUPS-IPP-1.1: CUPS Implementation of IPP
- CUPS-SAM-1.1.x: CUPS Software Administrators Manual
- CUPS-SDD-1.1: CUPS Software Design Description
- CUPS-SPM-1.1.x: CUPS Software Programming Manual
- CUPS-SSR-1.1: CUPS Software Security Report
- CUPS-STP-1.1: CUPS Software Test Plan
- CUPS-SUM-1.1.x: CUPS Software Users Manual
- CUPS-SVD-1.1: CUPS Software Version Description

#### 2.2 Other Documents

The following non-CUPS documents are referenced by this document:

- Adobe PostScript Printer Description File Format Specification, Version 4.3.
- Adobe PostScript Language Reference, Third Edition.
- IPP: Job and Printer Set Operations
- IPP/1.1: Encoding and Transport
- IPP/1.1: Implementers Guide
- IPP/1.1: Model and Semantics
- RFC 1179, Line Printer Daemon Protocol
- RFC 2567, Design Goals for an Internet Printing Protocol
- RFC 2568, Rationale for the Structure of the Model and Protocol for the Internet Printing Protocol
- RFC 2569, Mapping between LPD and IPP Protocols
- RFC 2616, Hypertext Transfer Protocol HTTP/1.1
- RFC 2617, HTTP Authentication: Basic and Digest Access Authentication

## 3 Test Procedure

The test software and data files are located in the *test* subdirectory of the source distribution. A script is provided to compile the ipptest program and run all of the tests that follow, producing a success/fail report.

The test target of the top-level makefile can be used to run this script:

```
make test
```

or you can run the test script directly:

```
cd test
./run-stp-tests
```

A Software Test Report is stored in HTML and PDF files that are generated using the HTMLDOC software.

3 Test Procedure 5

6 3 Test Procedure

## **4 IPP Compliance Tests**

This section describes the tests used to validate the IPP standards compliance of the CUPS server.

### 4.1 Request Tests

These tests verify that the CUPS scheduler only accepts valid IPP requests that start with the attributes-charset and attributes-natural-language attributes and also contain a printer-uri or job-uri attribute.

It also verifies that the CUPS scheduler always responds with attributes-charset and attributes-natural-language attributes, using default values if they are not provided by the client.

## 4.2 CUPS Printer Operation Tests

These tests verify that the CUPS printer operations are supported and function properly. Two printers called Test1 and Test2 are created, one as a PostScript printer and one as a raster printer.

### 4.3 Job Operation Tests

These test verify that the CUPS scheduler accepts print jobs for all supported file formats and that the cancel-job, hold-job, and resume-job operations work.

## **5 Command Tests**

This section describes the tests used to validate the Berkeley and System V commands included with CUPS.

### 5.1 lpadmin

This test verifies that printers can be added, modified, and defaulted using the lpadmin command.

### 5.2 lpc

This test verifies that the lpc command can show the current status of all print queues.

## 5.3 lpq

This test verifies that the lpq command lists any jobs in the queue.

### 5.4 lpstat

This test verifies that the lpstat command works with all reports using the "-t" option.

## 5.5 lp

This test verifies that the 1p command works with both the default destination and a specific destination.

### 5.6 lpr

This test verifies that the lpr command works with both the default destination and a specific destination.

### **5.7 lprm**

This test verifies that the lprm command can properly cancel a job.

### 5.8 cancel

This test verifies that the cancel command can properly cancel a job or all jobs.

## 5.9 Ipinfo

This test verifies that the lpinfo command returns a list of available printer drivers and devices.

5 Command Tests 9

10 5 Command Tests

## **A Glossary**

#### A.1 Terms

C

A computer language.

parallel

Sending or receiving data more than 1 bit at a time.

pipe

A one-way communications channel between two programs.

serial

Sending or receiving data 1 bit at a time.

socket

A two-way network communications channel.
